

# Conditional Probability and Cards

- A standard deck of cards has:
  - 52 Cards in 13 values and 4 suits
  - Suits are **Spades**, **Clubs**, **Diamonds** and **Hearts**
  - Each suit has 13 card values:  
2-10, 3 “face cards” Jack, Queen, King (J, Q, K)  
and and Ace (A)

# Basic Card Probabilities

- If you draw a card at random, what is the probability you get:
  - A Spade?  $P(\text{Spade}) = 13/52$
  - A Face card?  $P(\text{Face Card}) = 12/52$  (or simply  $3/13$ )
  - A Red Ace?  $P(\text{Red Ace}) = 2/52$

# Multiple Draws without Replacement

- If you draw 3 cards from a deck one at a time what is the probability:
  - All 3 cards are Red?
    - $P(1^{\text{st}} \text{ is red} \cap 2^{\text{nd}} \text{ is red} \cap 3^{\text{rd}} \text{ is red})$   
=  $P(1^{\text{st}} \text{ is red}) * P(2^{\text{nd}} \text{ is red}) * P(3^{\text{rd}} \text{ is red})$  by independence  
=  $(26/52) * (25/51) * (24/50) = .1176$
  - You don't draw any Spades?
    - $P(1^{\text{st}} \text{ isn't Spade} \cap 2^{\text{nd}} \text{ isn't Spade} \cap 3^{\text{rd}} \text{ isn't Spade})$   
=  $P(1^{\text{st}} \text{ isn't Spade}) * P(2^{\text{nd}} \text{ isn't Spade}) * P(3^{\text{rd}} \text{ isn't Spade})$   
=  $(39/52) * (38/51) * (37/50) = .4135$

# Multiple Draws without Replacement

- If you draw 3 cards from a deck one at a time what is the probability:
  - You draw a Club, a Heart and a Diamond (in that order)
    - $P(1^{\text{st}} \text{ is Club} \cap 2^{\text{nd}} \text{ is Heart} \cap 3^{\text{rd}} \text{ is Diamond})$   
 $= P(1^{\text{st}} \text{ is Club}) * P(2^{\text{nd}} \text{ is Heart}) * P(3^{\text{rd}} \text{ is Diamond})$   
 $= (13/52) * (13/51) * (13/50) = .0166$
  - In any order?
    - There are 6 possible orders (CHD, CDH, DCH, DHC, HCD, HDC) and each is equally likely, so we can multiply .0166 by 6 to get .0996

# Independence and Cards

- Are the events “Drawing an Ace” and “Drawing a Red Card” independent?
  - If  $P(\text{Red Ace}) = P(\text{Red}) * P(\text{Ace})$  then yes. Check:
    - $P(\text{Red Ace}) = 2/52 = 1/26$
    - $P(\text{Red}) * P(\text{Ace}) = (1/2) * (1/13) = 1/26$
    - Yes, they are independent!
